

Contents

Preface	vii
1 Core Transformations	1
1.1 Upper Hessenberg Matrices	1
1.2 QR Decomposition Using Core Transformations	2
1.3 Operating with Core Transformations	6
1.4 Some Details about Core Transformations	13
1.5 Backward Stability Basics	20
2 Francis’s Algorithm	23
2.1 Description of the Algorithm	23
2.2 Why the Algorithm Works	26
2.3 Choice of Shifts	33
2.4 Where Is QR?	34
3 Francis’s Algorithm as a Core-Chasing Algorithm	37
3.1 Single-Shift Algorithm	37
3.2 Double-Shift Algorithm	41
3.3 Convergence and Deflation	45
3.4 The Singular Case	49
3.5 Backward Stability of Francis’s Algorithm	51
3.6 In Pursuit of Efficient Cache Use and Parallelism	52
4 Some Special Structures	59
4.1 Unitary Matrices	59
4.2 Unitary-Plus-Rank-One Matrices, Companion Matrices	60
4.3 Backward Stability: Unitary-Plus-Rank-One Case	72
4.4 Symmetric Matrices	81
4.5 Symmetric-Plus-Rank-One Matrices	84
5 Generalized and Matrix Polynomial Eigenvalue Problems	89
5.1 The Moler–Stewart QZ Algorithm	89
5.2 The Companion Pencil	90
5.3 Matrix Polynomial Eigenvalue Problems	94
5.4 Unitary-Plus-Rank- k Matrices	102
6 Beyond Upper Hessenberg Form	105
6.1 QR Decomposition by Core Transformations	105
6.2 Reduction to Condensed Form	107

6.3	Core-Chasing Algorithms on Twisted Forms	114
6.4	Double Steps and Multiple Steps	120
6.5	Convergence Theory	133
6.6	The Unitary Case Revisited	139
	Bibliography	143
	Index	149
