Contents

Preface **ix**

1 Introduction **1**
1.1 The $3\frac{1}{2}$ stages of mathematical research 1
1.2 What's wrong with standard quadrature? 1
1.3 An example: Filon quadrature 3

2 Asymptotic theory of highly oscillatory integrals **5**
2.1 Univariate asymptotic expansions 5
2.2 How good is an asymptotic method? 10
2.3 Unbounded intervals 13
2.4 Multivariate asymptotic expansions 13
2.5 More general oscillators 23

3 Filon and Levin methods **29**
3.1 Filon-type quadrature in an interval 29
3.2 Multivariate Filon-type quadrature 38
3.3 Levin methods 42
3.4 Filon or Levin? 56

4 Extended Filon method **59**
4.1 Extended Filon method 59
4.2 Choosing internal nodes 60
4.3 Error analysis of FJ and FCC 67
4.4 Adaptive Filon 74

5 Numerical steepest descent **79**
5.1 The asymptotic method of steepest descent 79
5.2 The numerical method of steepest descent 87
5.3 Implementation aspects 99
5.4 Multivariate integrals 101
5.5 More general oscillators 106

6 Complex-valued Gaussian quadrature **109**
6.1 Introduction 109
6.2 Complex-valued Gaussian quadrature for oscillatory integrals on $[-1,1]$ 115
6.3 Complex quadrature and uniform asymptotic expansions 125
6.4 A discussion 133

7 A highly oscillatory olympics **135**
7.1 Heat 1: No stationary points, eight function evaluations 135
7.2 Heat 2: A stationary point, 12 function evaluations 141
7.3 What is the best method? 145

8 Variations on the highly oscillatory theme **149**
8.1 Oscillatory integrals in theory and in practice 149
8.2 A singular integral with multiple oscillators 151
8.3 Integral transforms 158
8.4 Postscript 162

A Orthogonal polynomials **163**
A.1 Orthogonal polynomials on the real line 163
A.2 Orthogonal polynomials with complex weight function 169

Bibliography **171**

Index **179**
